

As an amateur radio operator, under callsign KA0MJ1, I am concerned that the proposed rulemaking to allow high speed internet over our utility power lines is going to cause undue interference to good portion of the amateur radio spectrum.

I am particularly concerned about amateur radio communications in the 2 meter and 70 centimeter amateur radio bands. Further, I would also be concerned about what impact this proposal would have on public safety communications, particularly in the high band VHF spectrum. I believe that very extensive engineering studies would be advised before any formal decision is made on this subject.

Although response has been low, I believe that a great number of amayeur radio operators are very concerned over this proposal.
